Incident Management (Tech & Non-Tech)

- Training for new joiners and refresher for current staff
- How we log, investigate, remediate, and close incidents
- The tools we use: Slack, PagerDuty, Riskonnect

What you'll be able to do

- Log an incident correctly and know who to notify first
- Explain each role's responsibility across the lifecycle
- Complete Riskonnect enrichment, PIRs, and Incident Actions
- Tell the difference between "Resolved" and final closure

Incident management is more than fixing the issue

- Any employee must identify and immediately log an incident
- The Operations Center (OC) is the initial point of contact for logging
- OC sets initial severity and ensures correct categorisation
- The process covers severity, investigation, documentation, remediation, and closure

Know who does what

Any Employee: identify and log the incident immediately

OC: log, set severity, categorise, create PagerDuty incident

Incident Owner: lead investigation and resolution, enrich Riskonnect

Legal: regulatory advice; included in all Sev 1 and Sev 2 incidents

ERM (2LOD) and Incident Commander: oversight and final closure

Logging starts in Slack, creation happens in PagerDuty

- Notify the OC in their public Slack channel to log an incident
- Some tech teams have alerts that auto-create incidents in PagerDuty
- PagerDuty creates the incident and an Incident Response Slack channel
- Immediate priority is containment to prevent further impact

"Resolved" does not mean "Closed"

- OC updates PagerDuty to "Resolved" once the immediate issue is fixed
- PagerDuty auto-updates Riskonnect to "Resolved (not closed)"
- Final closure is a separate step performed later
- This is the most common misunderstanding — watch for it

The Incident Owner enriches the record in Riskonnect

- Complete all required fields across Information, Impacts, and Financial Loss Recoverability
- Attach any files related to the incident
- Link the Post Incident Review document in the relevant field
- Data enrichment continues after active firefighting ends

PIRs are mandatory for Sev 2 and above

- Any incident of Severity 2 or higher requires a Post Incident Review
- The PIR must be completed within 2 weeks of severity classification
- The Incident Owner uploads it to Riskonnect
- Missing or late PIRs are a key compliance gap

Turn learnings into Incident Actions

- Incident Actions capture follow-up improvement (betterment) work
- The Incident Owner creates them in "Draft" or "Ready for Review"
- Only 2LOD (ERM) and OC can set an Incident Action to "Active"
- Example: after a human-error incident, draft revised SOPs to close the gap

Remediation and final closure

- For Sev 1 and Sev 2, Legal and Regulatory Compliance must assess
- Incident Owner finalises Riskonnect data and sets "Ready for Review"
- Incident Commander (OC/ERM) reviews and performs final closure
- Can close once all actions are created and active, even if execution is ongoing

Scenario — a Sev 2 with PagerDuty showing "Resolved"

- Confirm Riskonnect enrichment is complete
- Ensure the PIR is completed and uploaded within 2 weeks
- Create any required Incident Actions
- Set the record to "Ready for Review", then Incident Commander closes

Avoid these common mistakes

- Assuming "Resolved" means the incident is closed
- Forgetting PIRs are mandatory for Sev 2+ within 2 weeks
- Treating Incident Actions as optional
- Forgetting only OC and 2LOD can activate Incident Actions

Checkout.com

Remember the flow

- Log fast, contain quickly, document properly
- Create the right follow-up Incident Actions
- Do not confuse operational resolution with formal closure
